A; Molecule type: protein

A; Residues: 1-10 *BUR>

A; Note: the natural and synthetic hormones have the same biological activity

C; Comment: This hypothalamic hormone stimulates the secretion of both luteinizing and fc

C; Superfamily: gonadoliberin

C; Superfamily: gonadoliberin

C; Keywords: amidated carboxyl end; hormone; hypothalamus; pyroglutamic acid

F; 10/Modified site: pyrrolidone carboxyl end (Gly) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C; Accession: A61126

A.Title: Isolation of L-3-phenyllactyl-Phe-Lys-Ala-NH2 (Antho-KAamide), a novel neuropep
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A,Cross-references: UNIPROT:P58705
C;Comment: The carboxyl-terminal amide probably arises from cleavage of a following glyd
C;Keywords: amidated carboxyl end; neurropeptide; phenyllactylation
F;1/Modified site: 1-3-phenyllactic acid (Phe) #status experimental
F;4/Modified site: amidated carboxyl end (Ala) #status experimental

Urine glycopeptide.
Homo sapiens (Human).
Eukaryots, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Butheria; Primates; Catarrhini; Hominidae; Homo.
                                                                                                                                                                                                                                                                       οĘ
                                                                                                                                                                                                                                  -!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Found in the nerve cords and a variety ganglia particularly in the anterior regions.
-!- SIMILARITY: Belongs to the FARP (FMRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

"Identification in urine of a low-molecular-weight highly polar
glycopeptide containing cysteinyl-galactose.";
Blochem. J. 123:25P-25P(1971)
-!- FUNCTION: The identity of the glycoprotein from which this peptide
attributed. An erythroogree membrane glycopeptide having a similar
structure has also been found.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=20189894; PubMed=10723010; Predel R., Eckert M.; Predel R., Eckert M.; Tagma-specific distribution of FXPRLamides in the nervous system of the American cockroach."; Comp. "Fibrinopeptides A and B of baboons (Papio anubis, Papio hamadryas, and Theropithecus gelada): their amino acid sequences and evolutionary rates and a molecular phylogeny for the baboons.";
J. Biochem. 94:1973-1978 (1933).
-!- FUNCTION: Fibrinogen has a double function: yielding monomers that polymerize into fibrin and acting as a cofactor in platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chen T., Orr D.F., Bjourson A.J., McClean S., O'Rourke M., Hirst D.G., Rao P., Shaw C.;
"Novel bradykinins and their precursor cDNAs from European yellowbellied toad (Bombina variegata) skin.";
Eur. J. Biochem. 26:4693-4700(2002).
-!- FUNCTION: Produces in vitro relaxation of rat arterial smooth muscle and constriction of intestinal smooth muscle.
                                                                                                                                                                                                                                                           aggregation.
--- SUBUNT: Hexamer containing 2 sets of 3 nonidentical chains
(alpha, beta and gamma), linked to each other by disulfide bonds.
--- PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopepitdes A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   [Thr6]bradykinin.
